

Synthetic Aperture Radar (SAR) Experiment using the MIT IAP 2011 Laptop Based Radar*

Presented at the 2011 MIT Independent Activities Period (IAP)

**Gregory L. Charvat, PhD
MIT Lincoln Laboratory**

24 January 2011

***This work is sponsored by the Department of the Air Force under Air Force Contract #FA8721-05-C-0002. Opinions, interpretations, conclusions and recommendations are those of the authors and are not necessarily endorsed by the United States Government.**

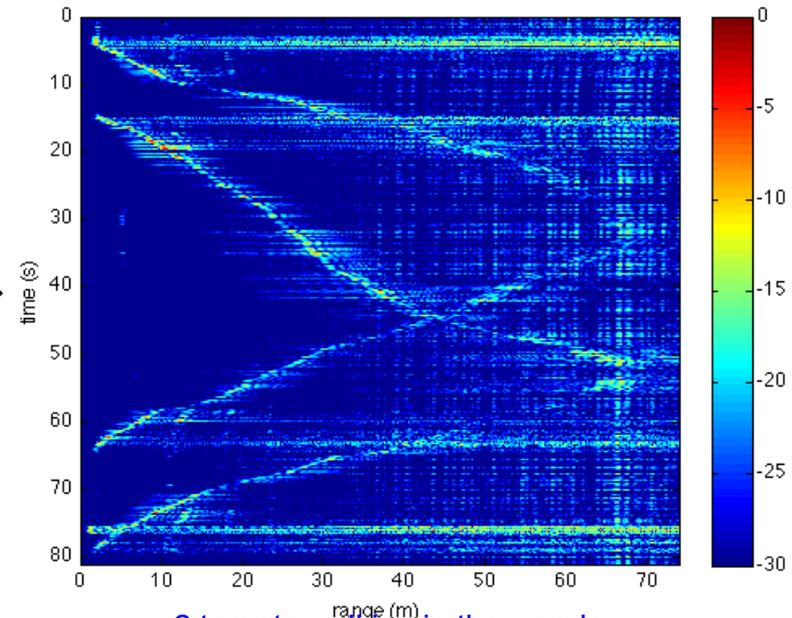

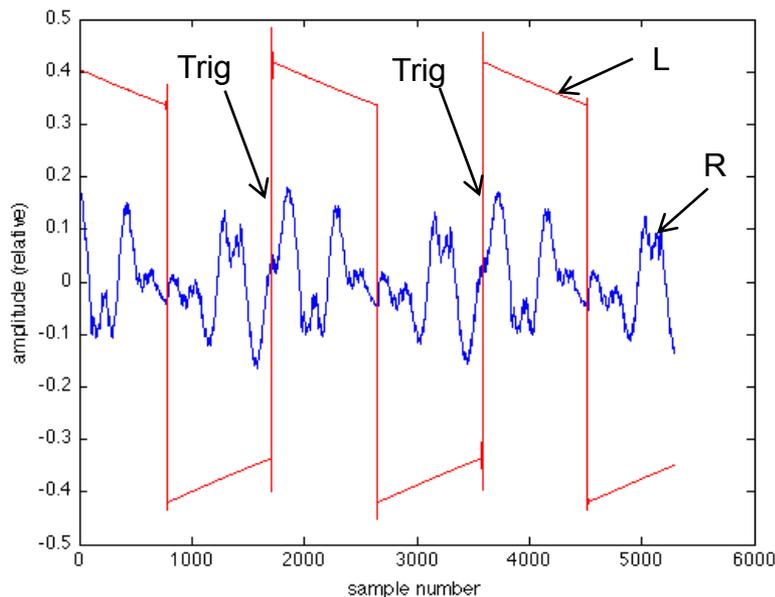

How to

- **Find a location with a straight rail approximately 10' long**
- **Record the R channel using the a .wav recording program**
- **Toggle sync line on and off for each range profile at 2" increments**
- **Pre-process then feed into SAR algorithm from Greg's dissertation**
- **E-mail results to us**

Radar Kit: Ranging vs. Time

1. Re-connect Vtune to modulator output.
2. Set up-ramp duration to 20 ms, adjust magnitude to span desired transmit bandwidth.
3. Deploy radar
4. Record a .wav file.
5. Process .wav using read_data_RTI.m
 - Looks for rising edges of sync pulse on Left channel
 - Saves 20 ms of Right channel data from rising edge, puts into array of de-chirped range profiles
 - Coherently subtracts the last range profile from the current one (2-pulse canceller)
 - Displays the log magnitude of the IDFT of the result as a range-time-indicator (RTI) plot

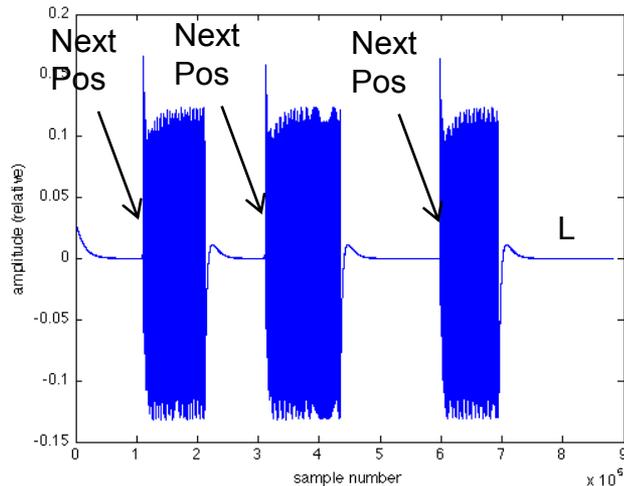

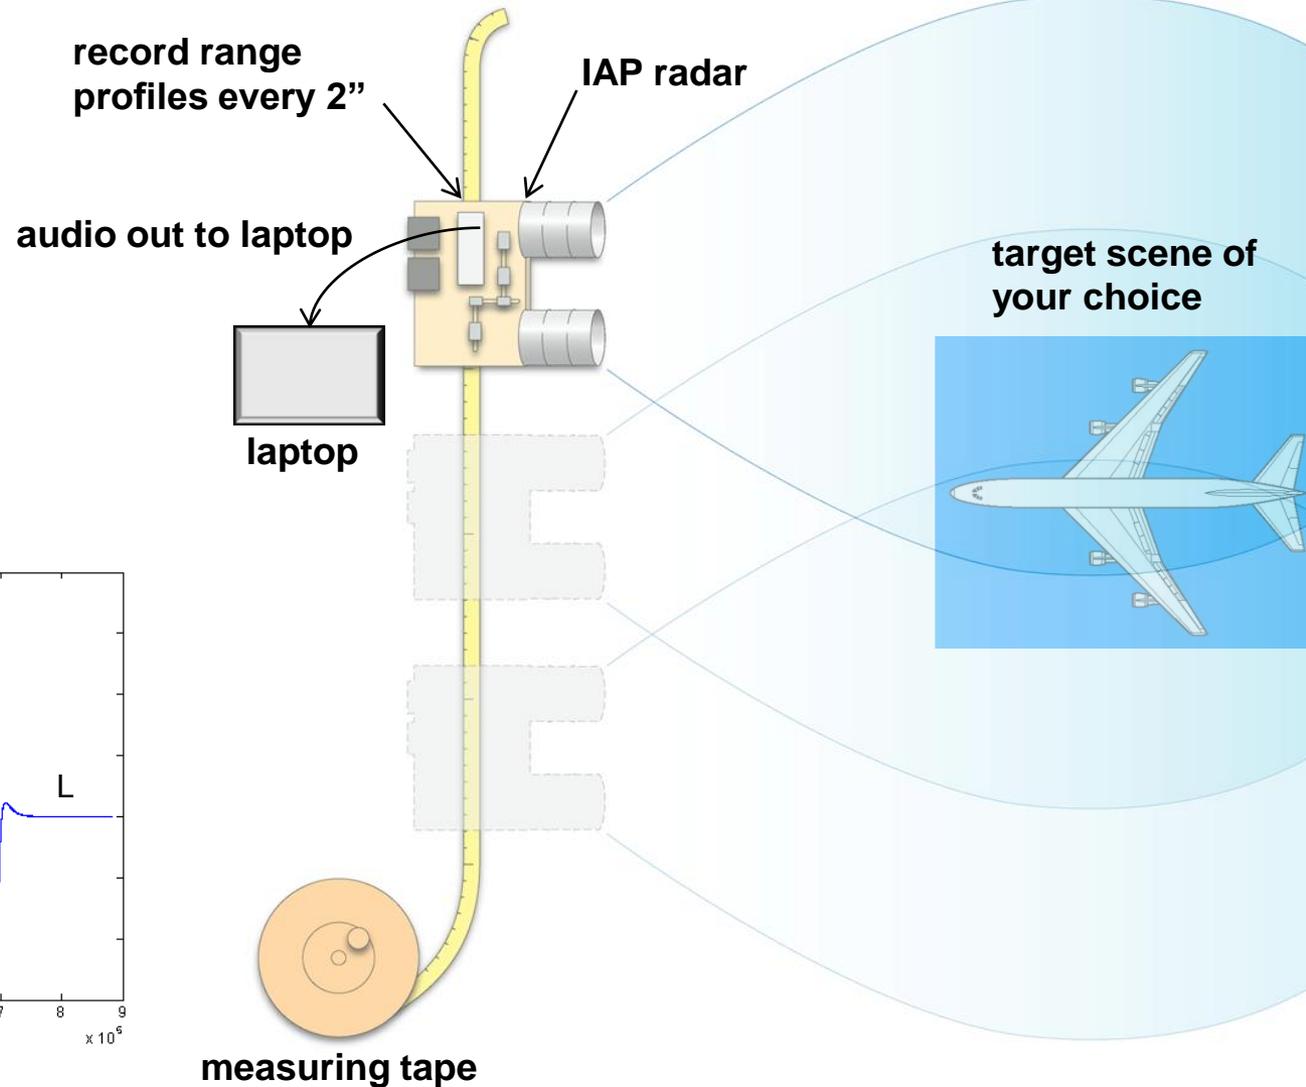

2 targets walking in the woods

Radar Kit: SAR Imaging

- Record .wav continuously
- Acquire range profiles at 2" increments over 8-10' of aperture length
- Use toggle switch to blank L sync channel, indicating change in radar position
- SBAND_RMA_opendata.m to process .wav file into SAR image, looking for gaps in sync pulses indicating new radar position
