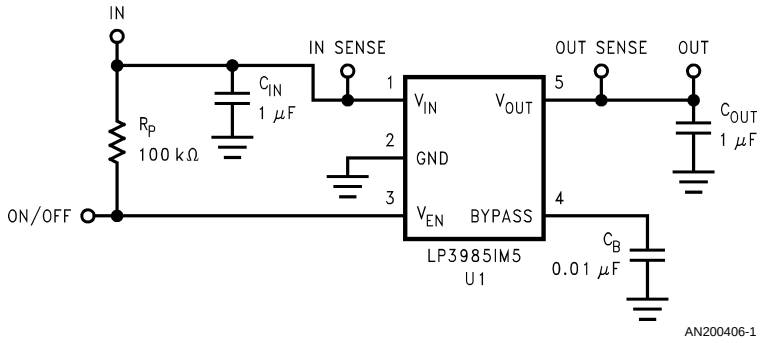
LP3985 SOT23-5 Evaluation Board Instruction

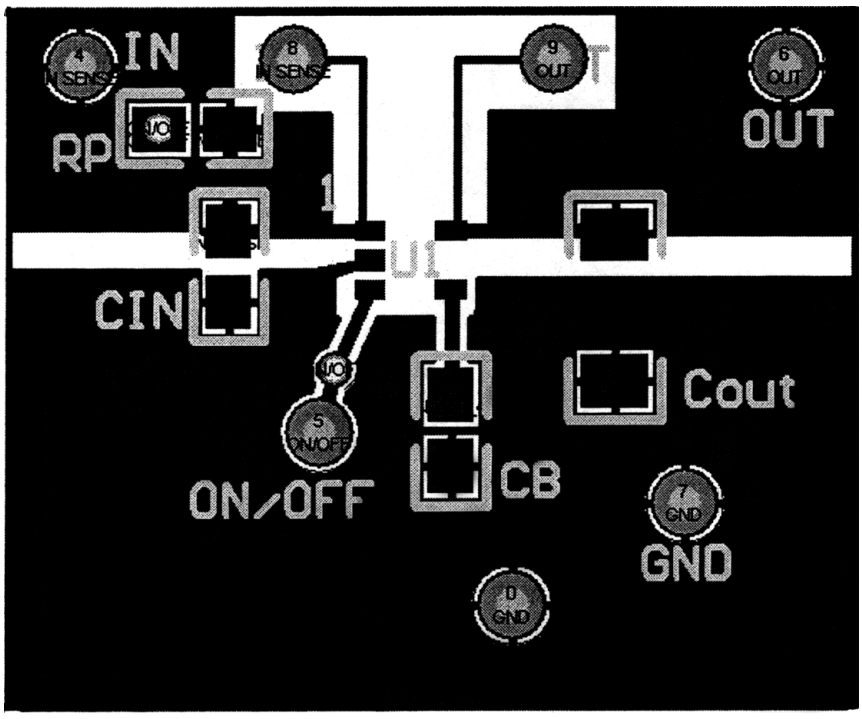
National Semiconductor
Application Note 1223
Mary F Kao
May 2002

INTRODUCTION

This evaluation board is designed to enable independent evaluation of the LP3985 electrical performances. Each board is assembled and tested in the factory. This evaluation board instruction is for the SOT23-5 package.

The schematic and layout of the evaluation board are given below:





The LP3985 is a micropower CMOS voltage regulator that can provide up to 150 mA of output current. The 0.01 µF bypass capacitor is optional; but if used, it will reduce noise on the regulator output. The RP resistor is tied to V_{IN} so that the regulator is on all the time. To control the V_{EN} pin externally, disconnect RP resistor and use the ON/OFF connector on the evaluation board.

The input sense and output sense pins are used for more precise voltage measurements. These pins are connected to the LP3985 input and output via high impedance traces.

The LP3985 is also available in 5 bump large bump micro SMD and 5 bump small bump micro SMD. Evaluation boards for these two packages are available as well.

Below is the bill of material for the LP3985 SOT23-5 board.

Designator	Value	Amount	Footprint	Note
RP	100 kΩ	1	0805	
CB	0.01 µF	1	0805	
C_{IN}	1 µF	1	0805	X5R or X7R
C_{OUT}	1 µF	1	1812	X5R or X7R
U1	LP3985IM5-xx	1	MF05A	The “xx” corresponds to the appropriate LDO output voltage option.
Test Pins		7		Keystone 1040
